Research Question

How can worker performance under a specific task constraint be improved?

Approach Brainstorming

- 1. Optimize Task Structure and Workflow
 - Adjust task sequence for maximum efficiency and a) minimum idle time
 - b) Streamline communication channels to reduce delays
- 2. Use Real-Time Feedback Mechanisms
 - Provide workers with timely feedback on task a) progress and accuracy
 - Feedback system can be based on predefined b) metrics and thresholds
- 3. Incorporate Adaptive Task Scheduling
 - Adapt the task schedule dynamically based on a) worker's pace and performance
 - b) Potentially increase flexibility in managing workload and focus areas
- 4. Analyze and Refine Ergonomics
 - Improve workstation layout and reduce repetitive a) strain through ergonomic adjustments
 - b) Use motion analysis to identify and correct inefficient or risky movements

Chosen Approach + Reasoning

Elimination:

#1 may require substantial workflow changes/training #2 focuses on immediate performance feedback #3 adds scheduling complexity without guarantee #4 enhances physical movement efficiency

Final Choice:

Use Real-Time Feedback Mechanisms in combination with Ergonomic Refinement processes to enhance task efficiency and reduce potential strain.

xample, the labels consist of 'good' and 'bad', and ey are assigned to each frame. For further entation, more precise labeling can be done in a e CVAT to easily train a model for other purposes
